

Diagnostics

Diagnostics is used to set data-related parameters for the VPet.

Auto OP MOD Optimization.

Automatically Calculate Reasonable Prices.

This feature is enabled by default. When active, the game automatically calculates reasonable prices for overpowered (OP) content in MODs, including all OP items in Better Buy and various OP projects in Interactions.

After disabling this feature, MOD items/Interaction content will be calculated using the values set by the MOD author. Using OP items/Interactions will cause the non-OP icon in the data menu to disappear.

If OP items/Interactions are used accidentally, you can restore the icon by reverting to a previous save.

If no overpowered (OP) data has been used, an icon will be displayed in the data menu for you to easily showcase your legitimate stats. 

Diagnostics and Feedback

Select the diagnostic data to be sent to LBGame. This data is used to protect and update VPet Simulator in a timely manner, to solve problems, and to improve the product. The game will run safely and normally regardless of which option is selected.

Essentially, it periodically sends save data to LBGame's servers to determine if the development data is normal (although admittedly, no one has ever looked at it).
